APPLICANT: Stafford, Robert G.
TITLE OF INVENTION: High Throughput Assays for the Proteolytic Activities of Clostridistrine OF INVENTION: High Throughput Assays for the Proteolytic Activities of Clostridistrine OF INVENTION: Neurotoxins
FILE REPERENCE: 003/224/SAP
CURRENT APPLICATION NUMBER: US/09/962,360B
CURRENT FILING DATE: 2002-08-19
PRIOR APPLICATION NUMBER: US 60/235,050
PRIOR PILING DATE: 2001-09-25
NUMBER OF SEQ ID NOS: 12
SOFTWARE: Apple Macintosh Microsoft Word 6.0
SEQ ID NO 8
LENGTH: 24
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 1, Application US/08743894B

Patent No. 5965699

Synaptosomal-associated protein 25 (SNAP-25) (Synaptosomal-associated
25 kDa protein).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            eliminarity).

-!-SUBUNIT: Part of the SNARE core complex containing SNAP25, VAMP2, and STXIA. This complex binds CPLXI. Interacts with TRIM9, RIMS1, SNAP25RP and HGS. Binds STXBP6. Found in a ternary complex with STXIA and VAMP8 (By similarity).
-!-PTM: Palaitoylated (By similarity).
-!-SIMILARITY: Belongs to the SNAP-25 family.
-!-SIMILARITY: Contains 2 t-SNARE coiled-coil homology domains.
                                                                                                                                                                                                                                                                                                                                                      GMNHINODMKEAEKNLKDLGKCGLFI (in isoform SNAP-25a).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            TISSUE-Hippocampus;

**Three-dimensional structure of the complexin/SNARE complex.";

**Neuron 33:397-409(2002)

**Intere-dimensional structure of the molecular regulation of neurotransmitter release. May play an important role in the neurotransmitter release. May play an important role in the proteins involved in vesicle docking and membrane fusion.

**PUBMIT: Part of the SNARE core complex containing SNARPS; VAMP2

**And STXIA. This complex binds CPLXI. Interacts with TRIM9, RIM51, SNARPSSEP and HGS. Binds STXRP6. Found in a ternary complex with analyzants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Event=Alternative splicing; Named isoforms=2; Comment=Isoforms differ by the usage of two alternative homologous exons (5a and 5b) which encode for positions 56 to 94 and differ only in 9 positions out of 39;

"Analysis of the mouse transcriptome based on functional annotation of
Nature 420:563-573(2002).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Event-Alternative splicing, Named isoforms=2, Comment=Isoforms differ by the usage of two alternative homologous exons (5a and 5b) which encode for positions 56 to 94 and differ only in 9 positions out of 39;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                MEDLINE-22347237; PubMed=12459461; DOI=10.1016/S0014-5793(02)03629-3; Hepp R., Cabaniols J.P., Roche P.A.; "Differential phosphorylation of SNAP-25 in vivo by protein kinase C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              neurotransmitter release. May play an important role in the synaptic function of specific neuronal systems. Associates with protein involved in vesicle docking and membrane fusion. SUBUNIT: Part of the SNARE core complex containing SNAP25, VAMP2 and STAXA. This complex binds CPLAI. Interacts with TRIM9, RIMS1, SNAP25BP and HGS. Binds STABB6. Found in a ternary complex with STAIA and VAMP8 (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   FEBS Lett. 512:52-56(2002).

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

a;Description: The sequence of C. elegans cosmid T26C12.
A;Reference number: Z21296

```
Botulinum serotype A/E substrate useful for assaying protease activity of botulinum toxins, comprises donor fluorophore, acceptor and a clostridial toxin recognition sequence that includes a cleavage site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (first entry)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (ALLR ) ALLERGAN INC.

The present invention relates to novel clostridium toxin substrates. The

```
unich comprise a donor fluorophore, an acceptor having an absorbance which comprise a donor fluorophore, an acceptor having an absorbance became overlation sequence comprising a cleavage site, where contrained the donor fluorophore and a comprise and under the appropriate conditions, the resonance energy transfer is exhibited between the donor and acceptor. Natural targets of clostridium neurotoxins include VAMP (synaptobrevin), SNAP-25 and syntaxin. Sequences of the invention are useful in assaying for the protease activity of any clostridial toxin including bacterial, baculoviral and yeast loxins (TeNT) in a sample including bacterial, baculoviral and yeast lysate, raw, cooked or processed foods, beverages, animal feed, soil samples. They are useful to assay a samples in abeverage or food samples. They are useful to assay a sample from a human or animal, for e.g., exposed to clostridial toxin or having one or more symptoms of a clostridial toxin, to follow activity during production and purification of clostridial toxin and cosmedics. The present sequence is fret unbatrate peptide used in the exemplification of the invention

```
The present invention fracts to hove to the droit substrates which comprise a donor fluorophore, an acceptor having an absorbance which comprise a donor fluorophore, an acceptor having an absorbance spectrum overlapping the emission spectrum of the donor fluorophore and a BONT A or BONT/B recognition sequence comporising a cleavage site, where the cleavage site intervenes between the donor fluorophore and acceptor and under the appropriate conditions, the resonance energy transfer is exhibited between the donor and acceptor. Natural targets of clostridium neurotoxins include VAMP (synaptobrevin), SNAP-25 and syntaxin. Sequences of the invention are useful in assaying for the protease activity of any clostridial toxin including betulinum toxins of all serotypes and tetanus toxins (TeNT) in a sample including betuerial, baculoviral and yeast lysate, raw, cooked or processed foods, beverages, animal feed, soil samples, water samples, cosmetics, tissue samples and beverage or food samples. They are useful to assay a sample from a human or animal, for e.g., exposed to clostridial toxin or having production and purification of clostridial toxin, to follow activity during production and purification of clostridial pharmaceuticals and cosmetics. The present sequence is fret substrate peptide used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
botulinum toxins, comprises donor fluorophore, acceptor and a clostridial toxin recognition sequence that includes a cleavage site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /note= "Tetramethylrhodamine labelled lysine; C-terminal amide"
                                                                                                the present invention relates to novel clostridium toxin substrates. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Clostridial toxin, protease activity, tetanus toxin, botulinum toxin, FRET; flourescence resonance energy transfer.

Determining clostridial toxin protease activity, by treating sample with clostridial substrate with donor fluorophore, acceptor, toxin recognition sequence, under conditions which exhibit resonance energy transfer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention provides clostridial toxin substrates useful in assaying for the protesse activity of any clostridial toxin including toxins of all serotypes as well setenum toxins. The present sequence is FRET (flourescence resonance energy transfer) substrate to analyse
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Example 1; Page 29; Opp; English

```
This sequence corresponds to residues 187-206 of the human 25 kD synaptosomal associated protein (SNAP-25), and is a inhibitory agent of the invention. The agents of the invention inhibit secretion of neurotransmitter from neuronal cells and is an excitation-secretory uncoupling peptide (I) of at least 20 amino acids (as) all of which correspond substantially to any one of AAW30097-W30102, or more generally correspond substantially to any one of AAW30097-W30102, or more generally correspond at a concentration of 10 microw, especially 0.25 microw, or lease (I) are used, as a replacement for Clostridium toxin, to inhibit release of neurotransmitters from synaptic vesicles, specifically for reducing muscle spasticity. Also (I) may be labelled to allow in vivo imaging of intracellular distribution of (I). Compounds for delivering the drug to neural cells provide targeted drug delivery, e.g. of the drug to neural cells provide targeted drug delivery, e.g. of substance P to brain timours for induction of apoptosis Unlike the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Neurotransmitter secretion; inhibitor; neuronal cell; synaptic vesicle; excitation-secretory uncoupling peptide; catecholamine secretion; bovine chromaffin cell; Clostridium toxin; muscle spasticity reduction; synaptosomal associated protein; SNAP-25.
proteolytic activity of botulinum toxin. This substrate is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Excitation-secretory uncoupling peptide(s) for inhibiting nuscle neuro:transmitter release - used particularly for treating muscle spasticity, and for delivering drugs specifically to neural cells.

                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                    Determining clostridial toxin protease activity, by treating sample with clostridial substrate with donor fluorophore, acceptor, toxin recognition sequence, under conditions which exhibit resonance energy transfer.
                                                                                                                                                                       The present invention provides clostridial toxin substrates useful in assaying for the protease activity of any clostridial toxin including toxins of all serotypes as well as tetanus toxins. The present sequence is FRET (flourescence resonance energy transfer) substrate to analyse proteolytic activity of botulinum toxin. This substrate is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Clostridial toxin; protease activity; tetanus toxin; botulinum toxin; FRET; flourescence resonance energy transfer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  FRET substrate #9 to analyse proteolytic activity of botulinum toxin.
                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to novel clostridium toxin substrates. The invention further relates to botulinum serotype A/E (BoNT/A/E) substrates which comprise a donor fluorophore, an acceptor having an absorbance spectrum overlapping the emission spectrum of the donor fluorophore and about A or BONT/E recognition sequence comprising a cleavage site, where the cleavage site intervenes between the donor fluorophore and acceptor and under the appropriate conditions, the resonance energy transfer is exhibited between the donor and acceptor. Natural targets of clostridium neurotoxins include VAMP (synaptobrevin), SNAP-25 and syntaxin. Sequences of the invention are useful in assaying for the profease activity of any clostridial toxin including bacterial, baculoviral and yeast toxins (TeNT) in a sample including bacterial, baculoviral and yeast lights, raw, cooked or processed foods, beverages, animal feed, soil
                                                                                                                                                                                                                                                                                                                                                                                                         /note= "Tetramethylrhodamine-modified Lysine; C-terminal amide; This residue is given as Xaa in the sequence shown as SEQ ID NO: 93 in the sequence listing of the specification"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Botulinum serotype A/E substrate useful for assaying protease activity of botulinum toxins, comprises donor fluorophore, acceptor and a clostridial toxin recognition sequence that includes a cleavage site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   samples, water samples, cosmetics, tissue samples and beverage or food samples. They are useful to assay a sample from a human or animal, for e.g., exposed to clostridial toxin or having one or more symptoms of a clostridial toxin, to follow activity during production and purification of clostridial toxin and to assay formulated clostridial toxin products including pharmaceuticals and cosmetics. The present sequence is fret

Determining clostridial toxin protease activity, by treating sample with clostridial substrate with donor fluorophore, acceptor, toxin recognition sequence, under conditions which exhibit resonance energy transfer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /note= "Tetramethylrhodamine labelled lysine; C-terminal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention provides clostridial toxin substrates useful in assaying for the protease activity of any clostridial toxin including toxins of all serctypes as well as tetanus toxins. The present sequence is FRET (flourescence resonance energy transfer) substrate to analyse proteolytic activity of bottuliuum toxin. This substrate is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Clostridial toxin; protease activity; tetanus toxin; botulinum toxin; FRET; flourescence resonance energy transfer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to novel clostridium toxin substrates. The invention further relates to botulinum serotype A/B (BoNI/A/B) substrates which comparise a donor fluorophore, an acceptor having an absorbance spectrum overlapping the emission spectrum of the donor fluorophore and a spectrum overlapping the emission spectrum of the donor fluorophore and a captor fluorophore and a captor fluorophore and a captor fluorophore and a captor fluorophore and acceptor and under the appropriate conditions, the resonance energy transfer is exhibited between the donor and acceptor. Natural targets of clostridium neurotoxins include VAMPP (synaptobrevin), SNAP-25 and syntaxin. Sequences of the invention are useful in assaying for the procease activity of any clostridial toxin including botulinum toxins of all serotypes and tetanus conting (TeNT) in a sample including botulinum toxins of all serotypes and tetanus lysate, raw, cooked or processed foods, beverages, animal feed, soil samples, water samples, consention, tissue samples and beverage or food samples, ray are useful to assay a sample from a human or animal, for egg, exposed to clostridial toxin or having one or more symptoms of a clostridial toxin, to follow activity during production and purification of clostridial toxin, products and clostridial toxin products and present and the acceptor of clostridial toxin products and the acceptor of clostridial toxin products and the acceptor of clostridial toxin man are and to clostridial toxin man are acceptor or acceptor of clostridial toxin products and the acceptor of clostridial toxin products and parts are acceptor or acceptor of clostridial toxin products and products and products and products and products and acceptor acceptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Botulinum serotype A/E substrate useful for assaying protease activity of botulinum toxins, comprises donor fluorophore, acceptor and a clostridial toxin recognition sequence that includes a cleavage site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               __note= "Tetramethylrhodamine-modified Lysine; C-terminal amide; This residue is given as Xaa in the sequence shown as SEQ ID NO: 88 in the sequence listing of the specification"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  clostridial toxin products

The present invention relates to novel clostridium toxin substrates. The invention further relates to botulinum serotype A/E (BoNT/A/E) substrates which comprise a donor fluorophore, an acceptor having an absorbance spectrum overlapping the emission spectrum of the donor fluorophore and a BONT A or BONT/E recognition sequence comprising a cleavage site, where the cleavage site intervenes between the donor fluorophore and acceptor and under the appropriate conditions, the resonance energy transfer is exhibited between the donor and acceptor. Natural targets of clostridium neurotoxins include VAMP (synaptobrevin), SNAP-25 and syntaxin. Sequences of the invention are useful in assaying for the protease activity of any clostridial toxin including botulinum toxins of all serotypes and tetanus toxins (TeNT) in a sample including bacterial, baculoviral and yeast lysate, raw, cooked or processed foods, beverages, animal feed, soil samples, water samples, cosmettics, tissue samples and beverage or food samples. They are useful to assay a sample from a human or animal, for e.g., exposed to clostridial toxin or having one or more symptoms of a clostridial toxin, to follow activity during production and purification of clostridial toxin and to assay a sample from a human or animal, for clostridial toxin, to follow activity during production and purification of clostridial toxin and cosmetics. The present sequence is fret substrate peptide used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                          /note= "Tetramethylrhodamine-modified Lysine; C-terminal amide; This residue is given as Xaa in the sequence shown as SEQ ID NO: 90 in the sequence listing of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Botulinum serotype A/E substrate useful for assaying protease activity of botulinum toxins, comprises donor fluorophore, acceptor and a clostridial toxin recognition sequence that includes a cleavage site.
                                                                                                                                                                                                                                                                                                                                  /note= "Fluorescein-modified Lysine; This residue is given as Xaa in the sequence shown as SEQ ID NO: 90 in the sequence listing of the specification"

This sequence corresponds to residues 181-206 of the human 25 kD crynaptosomal associated protein (SNAP-25), and is a inhibitory agent of the invention. The agents of the invention inhibit secretion of the invention. The agents of the invention inhibit secretion of meuroransmitter from neuronal cells and is an excitation-secretory concupling peptide (I) of at least 20 amino acids (aa) all of which correspond substantially to any one of AAW30097-W30102, or more generally concrespond substantially to any one of AAW30099-W30102, or more generally concrespond substantially to any concentration of 10 microM, especially 0.25 microM, or less. (I) are used, as a replacement for Clostridium toxin, to inhibit concrete spasticity. Also (I) may be absolided to allow in vivo imaging of intracellular distribution of (I). Compounds for delivering the drug to neural cells provide targeted drug delivery, e.g. of imaging of intracellular distribution of substance p to brain tumourse for induction of apoptosis. Unlike the substance of the obtain tumourse for induction of apoptosis. Unlike the available. Their therapeutic effect lasts for several days or weeks, so lower doses or less frequent treatments are required
                                Neurotransmitter secretion; inhibitor; neuronal cell; synaptic vesicle; excitation-secretory uncoupling peptide; catecholamine secretion; bovine chromaffin cell; Clostridium toxin; muscle spasticity reduction; synaptosomal associated protein; SNAP-25.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Excitation-secretory uncoupling peptide(s) for inhibiting nuscle neuro:transmitter release - used particularly for treating muscle spasticity, and for delivering drugs specifically to neural cells.
Neurotransmitter secretion inhibitor #3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 13; Page 31; 61pp; English.

Goldfish SNAP-25A peptide

Goldfish, clostridium toxin; protease activity, botulinum toxin; BONT; tetanus toxin; VAMP; synaptobrevin; SNAP-25; syntaxin; pharmaceutical; TeNT; cosmetic.

Goldfish; clostridium toxin; protease activity; botulinum toxin; BONT; tetanus toxin; VAMP; synaptobrevin; SNAP-25; syntaxin; pharmaceutical;

Carassius auratus

```
The present invention relates to novel clostridium toxin substrates. The invention further relates to botulium serotype A/E (BoNT/A/E) substrates which comprise a donor fluorophore, an acceptor having an absorbance of spectrum overlapping the emission spectrum of the donor fluorophore and a ceptor and under the appropriate conditions, the resonance energy transfer is the cleavage site intervenes between the donor fluorophore and acceptor and under the appropriate conditions, the resonance energy transfer is exhibited between the donor and acceptor. Natural targets of clostridium neurotoxins include VAMP (synaptobrevin), SNAP-25 and syntaxin. Sequences of the invention are useful in assaying for the protease activity of any clostridial toxin including botulium toxins of all serotypes and tetanus cotains (TeNT) in a sample including bacterial, baculoviral and yeast toxins (TeNT) in a sample including bacterial, baculoviral and yeast consertions are samples, cosmettics, tissue samples and beverage or food samples. They are useful to assay a sample from a human or animal, for e.g., exposed to clostridial toxin or having one or more symptoms of a clostridial toxin, and to assay formulated clostridial toxin and to assay formulated clostridial toxin products including pharmaceuticals and cosmetics. The present sequence is goldfish constitution.
                                                                                                                                                                                                                                                                                                                                                                                                         Botulinum serotype A/B substrate useful for assaying protease activity of botulinum toxins, comprises donor fluorophore, acceptor and a clostridial toxin recognition sequence that includes a cleavage site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The present invention relates to novel clostridium toxin substrates. The invention further relates to botulinum serotype A/E (BoNT/A/E) substrates which comprise a donor fluorophore, an acceptor having an absorbance spectrum overlapping the emission spectrum of the donor fluorophore and a context and acceptor and under the appropriate conditions. The resonance energy transfer is call under the appropriate conditions, the resonance energy transfer is exhibited between the donor and acceptor. Natural targets of clostridium neurotoxins include VAMP (synaptobrevin), SNAP-25 and syntaxin. Sequences of the invention are useful in assaying for the protease activity of any clostridial toxin including botulinum toxins of all serotypes and tetanus toxins (TeNT) in a sample including bacterial, baculoviral and yeast lysate, raw, cooked or processed foods, beverages, animal feed, soil samples. They are useful to assay a sample from a human or animal, for agamples. They are useful to assay a sample from a human or animal, for e.g., exposed to clostridial toxin or having one or more symptoms of a clostridial toxin, and to assay formulated clostridial toxin and to assay formulated clostridial toxin products including pharmaceutics. The present sequence is goldfish SNAP-25B peptide used in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Botulinum serotype A/B substrate useful for assaying protease activity of botulinum toxins, comprises donor fluorophore, acceptor and a clostridial toxin recognition sequence that includes a cleavage site.

The present invention relates to novel clostridium toxin substrates. The invention further relates to botulinum serotype A/B (BoNI/A/B) substrates which comprise a donor fluorophore, an acceptor having an absorbance spectrum overlapping the emission spectrum of the donor fluorophore and a spectrum overlapping the emission spectrum of the donor fluorophore and a not complete the classification of the donor fluorophore and a complete the classification of the donor fluorophore and acceptor and under the appropriate conditions, the resonance energy transfer is exhibited between the donor and acceptor. Natural targets of clostridium neurotoxins include VAMP (synaptobrevin), SNAP-25 and syntaxin. Sequences of the invention are useful in assaying for the protease activity of any clostridial toxin including botulium toxins of all serotypes and tetanus toxins (TeNT) in a sample including bacterial, baculoviral and yeast toxins (TeNT) in a sample including bacterial, baculoviral and yeast costed or proceased foods, beverages, animal feed, soil samples, water samples, cosmetics, tissue samples and beverage or food samples. They are useful to assay a sample from a human or animal, for e.g., exposed to clostridial toxin or having one or more symptoms of a clostridial toxin and to assay formulated clostridial toxin and to assay formulated clostridial toxin and to assay formulated clostridial toxin and cosmetics. The present sequence is SNAP-25
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Botulinum serotype A/E substrate useful for assaying protease activity of botulinum toxins, comprises donor fluorophore, acceptor and a clostridial toxin recognition sequence that includes a cleavage site.

The present invention relates to novel clostridium toxin substrates invention further relates to botulinum serotype A/E (BONT/A/E) substrates which comprise a donor fluorophore, an acceptor having an absorbance appetrum overlapping the emission spectrum of the donor fluorophore and about A or BONT/E recognition sequence comprising a cleavage site, where the cleavage site intervenes between the donor fluorophore and acceptor and under the appropriate conditions, the resonance energy transfer is exhibited between the donor and acceptor. Natural targets of clostridium neurotoxins include VAMP (synaptobrevin), SNAP-25 and syntaxin. Sequences of the invention are useful in assaying for the procease activity of any clostridial toxin including bactulinum toxins of all serotypes and tetamus toxins (TeNT) in a sample including bacterial, baculoviral and yeast the procease of the invention of all serotypes and tetamus and the contraction of the invention of all serotypes and procease and tetamus and the contraction of the invention of all serotypes and procease and tetamus and the contraction of the invention of all serotypes and procease and the contraction of the invention of all serotypes and procease and tetamus and the contraction of the invention of the invention of the procease and tetamus and the contraction of the contraction of the invention of the contraction of the contractio

Determining clostridial toxin protease activity, by treating sample with clostridial substrate with donor fluorophore, acceptor, toxin recognition sequence, under conditions which exhibit resonance energy transfer.

The present invention relates to novel clostridium toxin substrates. The invention further relates to botulinum serotype A/E (BoNT/A/E) substrates which comprise a donor fluorophore, an acceptor having an absorbance spectrum overlapping the emission spectrum of the donor fluorophore and a BoNT A or BONT/E recognition sequence comprising a cleavage site, where the cleavage site intervenes between the donor fluorophore and acceptor

Botulinum serotype A/B substrate useful for assaying protease activity of botulinum toxins, comprises donor fluorophore, acceptor and a clostridial toxin recognition sequence that includes a cleavage site.

WPI; 2003-290198/28.

                              The present invention provides clostridial toxin substrates useful in assaying for the protease activity of any clostridial toxin including toxins of all serotypes as well as tetanus toxins. The present sequence is FRET (flourescence resonance energy transfer) substrate to analyse proteolytic activity of botulinum toxin. This substrate is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /note= "EDANS-modified Lysine; C-terminal amide; This residue is given as Xaa in the sequence shown as SEQ ID NO: 95 in the sequence listing of the specification"

and under the appropriate conditions, the resonance energy transfer is exhibited between the donor and acceptor. Natural targets of clostridium neurotoxins include VAMP. (synaptobrevin), SNAP-25 and syntaxin. Sequences of the invention are useful in assaying for the protease activity of any clostridial toxin including botulinum toxins of all serotypes and tetanus toxins (TeNT) in a sample including bacterial, baculoviral and yeast toxins (TeNT) in a sample including bacterial, baculoviral and yeast samples, water samples, cosmetics, tissue samples and beverage or food samples. They are useful to assay a sample from a human or animal, for e.g., exposed to clostridial toxin or having one or more symptoms of a clostridial toxin, to follow activity during production and purification of clostridial toxin and to assay formulated clostridial toxin products including pharmaceuticals and cosmetics. The present sequence is fret substrate peptide used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              amide, This residue is given as Xaa in the sequence shown as SEQ ID NO: 92 in the sequence listing of the

The present invention relates to novel clostridium toxin substrates. The invention further relates to botulinum serotype A/E (BONT/A/E) substrates which comprise a donor fluorophore, an acceptor having an absorbance spectrum overlapping the emission spectrum of the donor fluorophore and a ceptor shown as a paraparate conditions. The resonance energy transfer is the cleavage site intervenes between the donor fluorophore and acceptor and under the appropriate conditions, the resonance energy transfer is exhibited between the donor and acceptor. Natural targets of clostridium curing the invention are useful in assaying for the protease activity of any clostridial toxin including botulinum toxins of all serotypes and tetanus contributed toxin including botulinum toxins of all serotypes and tetanus contributed including botulinum toxins of all serotypes and tetanus contributed toxin including botulinum toxins of all serotypes and tetanus contributed amples, cosmetics, tissue samples and beverage or food samples. They are useful to assay a sample from a human or animal, for camples. They are useful to assay a sample from a human or animal, for contridial toxin, to follow activity during production and purification of clostridial toxin and to assay formulated clostridial toxin products including pharmaceuticals and cosmetics. The present sequence is fret including pharmaceuticals and cosmetics. The present sequence is fret.

Determining clostridial toxin protease activity, by treating sample with clostridial substrate with donor fluorophore, acceptor, toxin recognition sequence, under conditions which exhibit resonance energy transfer.
                                                             assaying for the protease activity of any clostridial toxin including toxins of all serotypes as well as tetanus toxins. The present sequence is FRET (flourescence resonance energy transfer) substrate to analyse proteolytic activity of botulinum toxin. This substrate is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention provides clostridial toxin substrates useful in assaying for the protease activity of any clostridial toxin including toxins of all serotypes as well as tetanus toxins. Sequence 19 AA;

```
This sequence corresponds to residues 187-206 of the human 25 kD synaptosomal associated protein (SNAP-25), and is a inhibitory agent of the invention. The agents of the invention inhibit secretion of meurotransmitter from neuronal cells and is an excitation-secretory uncoupling peptide (I) of at least 20 anino acids (aa) all of which correspond substantially to any one of AAW30097-W30102, or more generally correspond substantially to any one of AAW30097-W30102, or more generally correspond substantially to any one of AAW30097-W30102, or more generally correspond finhibits 50% of catecholamine secretion from bowine chromaffin cells at a concentration of 10 microW, especially 0.25 microW, or lease of neurotransmitters from synaptic vesicles, specifically for reducing muscle spaticity. Also (I) may be labelled to allow in vivo imaging of intracellular distribution of (I). Compounds for delivering the drug to neural cells provide targeted drug delivery, e.g. of the drug to neural cells provide targeted drug delivery, e.g. of the control of 10 are not toxic or immunogenic and are more readily available. Their therapeutic effect lasts for several days or weeks, so lower doses or less frequent treatments are required
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                         Neurotransmitter secretion; inhibitor; neuronal cell; synaptic vesicle; excitation-secretory uncoupling peptide; catecholamine secretion; bovine chromaffin cell; Clostridium toxin; muscle spasticity reduction; synaptosomal associated protein; SNAP-25.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Excitation-secretory uncoupling peptide(s) for inhibiting nuscle neuro:transmitter release - used particularly for treating muscle spasticity, and for delivering drugs specifically to neural cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

The present invention relates to novel clostridium toxin substrates. The invention further relates to botulinum serotype A/B (BoNT/A/B) substrates which comprise a donor fluorophore, an acceptor having an absorbance spectrum overlapping the emission spectrum of the donor fluorophore and acceptor spectrum overlapping the emission spectrum of the donor fluorophore and acceptor and under the appropriate conditions, the resonance energy transfer is and under the appropriate conditions, the resonance energy transfer is exhibited between the donor and acceptor. Natural targets of clostridium convincions are useful in assaying for the protease activity of any clostridial toxin including botulinum toxins of all serotypes and tetanus conting (TeNT) in a sample including botulinum toxins of all serotypes and tetanus lysate, raw, cooked or processed foods, beverages, animal feed, soil samples. They are useful to assay a sample from a human or animal, for egg, exposed to clostridial toxin or having one or more symptoms of a clostridial toxin, to follow activity during production and purification of clostridial toxin, products assay formulated clostrin products
                                                                                                                                                                                                                                                                                                                                                                                                                      /note= "Tetramethylrhodamine-modified Lysine; C-terminal amide; This residue is given as Xaa in the sequence shown as SEQ ID NO: 88 in the sequence listing of the specification"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Botulinum serotype A/B substrate useful for assaying protease activity of botulinum toxins, comprises donor fluorophore, acceptor and a clostridial toxin recognition sequence that includes a cleavage site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            of clostridial toxin and to assay formulated clostridial toxin products including pharmaceuticals and cosmetics. The present sequence is fret substrate peptide used in the exemplification of the invention

invention further relates to botulinum serotype A/E (BONN/A/E) substrates which comprise a donor fluorophore, an acceptor having an absorbance spectrum overlapping the emission spectrum of the donor fluorophore and a BONT A or BONN/E recognition sequence comprising a cleavage site, where the cleavage site intervens between the donor fluorophore and acceptor and under the appropriate conditions, the resonance energy transfer is exhibited between the donor and acceptor. Natural targets of clostridium neurotoxins include VAMP (synaptobrevin), SNAP-25 and syntaxin. Sequences of the invention are useful in assaying for the protease activity of any clostridial toxin including bacterial, baculoviral and yeast toxins (TeNT) in a sample including bacterial, baculoviral and yeast lysate, raw, cooked or processed foods, beverages, animal feed, soil samples. They are useful to assay a samples and beverage or food samples. They are useful to assay a sample from a human or animal, for e.g., exposed to clostridial toxin or having one or more symptoms of a clostridial toxin, to follow activity during production and purification of clostridial toxin and to assay formulated clostridial toxin products including pharmaceuticals and cosmetics. The present sequence is fret unbatrate peptide used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Botulinum serotype A/E substrate useful for assaying protease activity of botulinum toxins, comprises donor fluorophore, acceptor and a clostridial toxin recognition sequence that includes a cleavage site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    present invention relates to novel clostridium toxin substrates. Determining clostridial toxin protease activity, by treating sample with clostridial substrate with donor fluorophore, acceptor, toxin recognition sequence, under conditions which exhibit resonance energy transfer.
                                                                                                                                                                                                                                                                                           /note= "Tetramethylrhodamine labelled lysine; C-terminal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention provides clostridial toxin substrates useful in assaying for the protease activity of any clostridial toxin including toxins of all serotypes as well as tetanus toxins. The present sequence is FRET (flourescence resonance energy transfer) substrate to analyse proteclytic activity of botulinum toxin. This substrate is used in the
                                                                                                                                                    Clostridial toxin, protease activity, tetanus toxin, botulinum toxin, FRET, flourescence resonance energy transfer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                       FRET substrate #4 to analyse proteolytic activity of botulinum toxin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              89.9%; Score 89; DB 7; Length 24; 100.0%; Pred. This sequence corresponds to residues 181-206 of the human 25 kD synaptosomal associated protein (SNAP-25), and is a inhibitory agent of the invention. The agents of the invention inhibit secretion of the invention. The agents of the invention inhibit secretion of correspond substantially to any one of AAM30097-W30102, or more generally correspond substantially to any one of AAM30097-W30102, or more generally correspond substantially to any one of AAM30097-W30102, or more generally correspond substantially to any one of AAM30097-W30102, or more generally correspond substantially to any one of AAM30097-W30102, or more generally correspond substantially to any one of AAM30097-W30102, or more generally correspond substantially as a replacement for Clostridium toxin, to inhibit correction muscle spacificity. Also (I) may be labelled to allow in vivo imaging of intracellular distribution of (I). Compounds for delivering the drug to neural cells provide targeted drug delivery, e.g. of substance P to brain tumours for induction of apoptoals Unite the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 neurotoxins, (I) are not toxic or immunogenic and are more readily available. Their therapeutic effect lasts for several days or weeks, so lower doses or less frequent treatments are required
                                Neurotransmitter secretion; inhibitor; neuronal cell; synaptic vesicle; excitation-secretory uncoupling peptide; catecholamine secretion; bovine chromaffin cell; Clostridium toxin; muscle spasticity reduction; synaptosomal associated protein; SNAP-25.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Excitation-secretory uncoupling peptide(s) for inhibiting neuro:transmitter release - used particularly for treating muscle spasticity, and for delivering drugs specifically to neural cells.
Neurotransmitter secretion inhibitor #3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 13; Page 31; 61pp; English.

Carassius auratus.

```
The present invention relates to novel clostridium toxin substrates. The invention further relates to botulinum serotype A/B (BONT/A/B) substrates which comprise a donor fluorophore, an acceptor having an absorbance spectrum overlapping the emission spectrum of the donor fluorophore and a spectrum overlapping the emission spectrum of the donor fluorophore and a contract and under the appropriate conditions, the resonance energy transfer is cand under the appropriate conditions, the resonance energy transfer is cand under the appropriate conditions, the resonance energy transfer is cand under the appropriate conditions, the protesse of clostridium control invention are useful in assaying for the protesse activity of any clostridial toxin including botulium toxins of all serotypes and tetanus control in a sample including bacterial baculoviral and yeast toxins (TeNT) in a sample including bacterial baculoviral and yeast control samples, water samples, cosmetics, tissue samples and beverage or food samples. They are useful to assay a sample from a human or animal, for samples. They are useful to assay a sample from a human or animal, for callostridial toxin, to follow activity during production and purification of clostridial toxin and cosmetics. The present sequence is goldfish
                                                                                                                                                                                                                                                                                                                                                                                                   Botulinum serotype A/E substrate useful for assaying protease activity of botulinum toxins, comprises donor fluorophore, acceptor and a clostridial toxin recognition sequence that includes a cleavage site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Goldfish; clostridium toxin; protease activity; botulinum toxin; BoNT; tetanus toxin; VAMP; synaptobrevin; SNAP-25; syntaxin; pharmaceutical;

RESULT 15 AAE36678 SNAP-25 peptide

The present invention relates to novel clostridium toxin substrates. The invention further relates to botulinum serotype A/B (BoWT/A/B) substrates which comprise a donor fluorophore, an acceptor having an absorbance spectrum overlapping the emission spectrum of the donor fluorophore and about A or BoNT/E recognition spectrum of the donor fluorophore and acceptor and under the appropriate conditions, the resonance energy transfer is exhibited between the donor and acceptor. Natural targets of clostridium neurotoxins include VAMP (synaptobrevin), SNAP-25 and syntaxin. Sequences of the invention are useful in assaying for the protease activity of any clostridial toxin including boculinum toxins of all serotypes and tetanus toxins (TeNT) in a sample including bacterial, baculoviral and yeast layere, and processed foods, beverages, animal feed, soil samples, water samples, cosmetics, tissue samples and beverage or food samples. They are useful to assay a sample from a human or animal, for e.g., exposed to clostridial toxin or having one or more symptoms of a clostridial toxin, to follow activity during production and purification of clostridial toxin and to assay formulated clostridial toxin products including pharmaceuticals and cosmetics. The present sequence is goldfish SNAP-25B peptide used in the invention Botulinum serotype A/B substrate useful for assaying protease activity of botulinum toxins, comprises donor fluorophore, acceptor and a clostridial toxin recognition sequence that includes a cleavage site. Botulinum serotype A/E substrate useful for assaying protease activity of botulinum toxins, comprises donor fluorophore, acceptor and a clostridial toxin recognition sequence that includes a cleavage site.

Disclosure; Page 42; 168pp; English.

The present invention relates to novel clostridium toxin substrates. The invention further relates to botulinum serotype A/E (BoNT/A/E) substrates which comprise a donor fluorophore, an acceptor having an absorbance spectrum overlapping the emission spectrum of the donor fluorophore and a prectrum overlapping the emission sequence comprising a cleavage site, where the cleavage site intervenes between the donor fluorophore and acceptor and under the appropriate conditions, the resonance energy transfer is exhibited between the donor and acceptor. Natural targets of clostridium neurotoxins include VAMP (synaptobrevin), SNAP-25 and syntaxin. Sequences of the invention are useful in assaying for the protease activity of any clostridial toxin including botulium toxins of all serotypes and tetanus toxins (TeNT) in a sample including bacterial, baculoviral and yeast colstridial toxin including bacterial, beverages, animal feed, soil samples, water samples, cosmetics, tissue samples and beverage or food samples. They are useful to assay a sample from a human or animal, for e.g., exposed to clostridial toxin or having production and purification of clostridial toxin and to assay formulated clostridial toxin and cosmetics. The present sequence is SNAP-25 including pharmaceutics. The present sequence is SNAP-25 peptide used in the invention

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                         (without alignments)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ઠે
           Sequence 11, Application US/11195098

Publication No. US20050287622A1

GENERAL INFORMATION

APPLICANT: Schmidt, James J.

APPLICANT: Schmidt, James J.

APPLICANT: Schmidt, James J.

TITLE OF INVENTION: High Throughput Assays for the Protecolytic Activities of Clostrid

TITLE OF INVENTION: Neurotoxins

TITLE OF INVENTION: Neurotoxins

TITLE OF INVENTION: NUMBER: US/11/195,098

CURRENT APPLICATION NUMBER: US/10/802,574

PRIOR APPLICATION NUMBER: US/0962,360

PRIOR PILING DATE: 2004-03-17

PRIOR APPLICATION NUMBER: US 60/235,050

PRIOR APPLICATION NUMBER: US 60/235,050

PRIOR PILING DATE: 2001-09-25

NUMBER OF SEQ ID NOS: 12

SEQ ID NO 11

LEASTH: 116

LEASTH: 116

Sequence 60, Application US/10261161

Publication No. US20040072270A1

GENERAL INFORMATION:

APPLICANT: Fernandez-Salas, Ester

APPLICANT: Steward, Lance E.

APPLICANT: Steward, Lance E.

APPLICANT: Acki, Kei Roger

TITLE OF INVENTION: Transfer (FRET) Assays For Clostridial Toxins

FILE REFERENCE: P-AR 4804

CURRENT APPLICATION UNUMBER: US/10/261,161

CURRENT FILING DATE: 2002-09-27

NUMBER OF SEQ ID NOS: 109

SOFTWARE: FRANCE: PAR 4804

CURRENT FILING DATE: 2002-09-27

NUMBER OF SEQ ID NOS: 109

SEQ ID NO 60

LENGTH: 33

TYPE: PRT

ORGANISM: Carassius auratus

--- TISSUE SPECIFICITY: Neurons of the neocortex, hippocampus, piriform cortex, anterior thalamic nuclei, pontine nuclei, a granule cells of the cerebellum.
--- SIMILARITY: Belongs to the SNAP-25 family.
--- SIMILARITY: Contains 2 t-SNARE coiled-coil homology domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              85 92 Cys-rich.

Synaptosomal-associated protein 15 (SNAP-25) (Synaptosomal-associated
25 kDa protein) (Super protein) (SUP).
Name-SNAP25; Synonyma-SNAP;
Gallus gallus (Chicken).
Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;
Archosauria; Aves; Neognathae; Galliformes; Phasianidae;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Similarity).
SUBUNIT: Part of the SNARE core complex containing SNAP25, VAMP2 and STXIA. This complex binds CPLXI. Interacts with TRIM9, RIMSI and SYRAP55BP. Binds STXEP6. Found in a ternary complex with STXIA and VAMM8 (By similarity).
